

Traffic Control Plan for 46th Avenue Reconstruction

This study was conducted for the Town of Edmonston, Maryland. 46th Avenue is a two lane roadway with numerous driveways. The construction plan required that the road be closed in one direction but allow access to the properties at all times. A traffic control plan was developed that included a detour plan as well as a plan to permit access to the properties. A detour plan was also developed to permit reconstruction in the other direction.
